Natural Language Models and Interfaces

BSc Artificial Intelligence

Lecturer: Wilker Aziz Institute for Logic, Language, and Computation

2020, week 1, lecture a

NLMI

Course organisation

Why NLP?

Why is NLP hard?

An overview of problems

An overview of the statistical method

Language data: first contact

Course

Topic: Statistical Natural Language Processing

Team

- ► Instructors: Wilker Aziz and Lieuwe Rekker
- Assistants: Daniel, Mitchell, Putri, Puck, Tim, Zarah

Attendance

- lectures: not monitored, but encouraged
- laptopcollege and werkcollege: highly encouraged! develop homework (lab assignments and written report)

Course information

Canvas

- course manual
- weekly materials: readings, slides, exercises
- assignments
- notifications

Textbook

Jurafsky & Martin, Speech and Language Processing (3rd edition)

Any additional material will be announced in class and on canvas

Assessment

Exams

- ► Mid-term (individual): 30%
- Final (individual): 30%

Assessment

Exams

- ► Mid-term (individual): 30%
- Final (individual): 30%

Assignments

- 5 homework assignments:
 - one week per assignment
 - except the last assignment which spans over 2 weeks
- jupyter notebook exercises

25%

- to be done in pairs (obligatory)
- change your partner during the midterm week (obligatory)
- ▶ individual: academic writing skills
 15%

Assessment

Exams

- ► Mid-term (individual): 30%
- Final (individual): 30%

Assignments

- ▶ 5 homework assignments:
 - one week per assignment
 - except the last assignment which spans over 2 weeks
- jupyter notebook exercises

25%

- to be done in pairs (obligatory)
- change your partner during the midterm week (obligatory)
- individual: academic writing skills

15%

Ungraded quizzes and lists of exercises

Final grade

Weighted average

$$\begin{aligned} \text{grade} &= 1 + \frac{9}{10} \left(\underbrace{0.3 \times \text{midterm} + 0.3 \times \text{final exam}}_{\text{exam component}} \right. \\ &+ \underbrace{0.25 \times \text{notebooks} + 0.15 \times \text{report}}_{\text{assignment component}} \right) \end{aligned}$$

where

- ightharpoonup your exam component must be ≥ 5
- lacktriangle your assignments component must be ≥ 5

Rounding

we round grades to the nearest half point

Deadlines

Assignments become available on Tuesday morning and are due by Friday 6 PM.

- submission through canvas only assignments submitted by any other form will be ignored
- these are hard deadlines
- ▶ late submissions are not graded and thus score 0
- exceptions to this rule may be warranted on a per case basis condition on a valid reason: if necessary, reach out to your TA
 — though note TAs will not decide, instead they will make a case on your behalf, ultimately Lieuwe and I will decide.

Quizzes and exercises

Exam-type questions

- Quizzes (in class) prepare your phone to scan QR codes or use the link on the slides
- ► Lists of exercises (after class)

Why NLP?

Why is NLP hard?

An overview of problems

An overview of the statistical method

Language data: first contact

What about processing language?

It's everywhere!

► We talk about things
I love Paris! All those bridges, the cathedral, the Louvre, oh
and of course, the tower!

What about processing language?

It's everywhere!

- We talk about things I love Paris! All those bridges, the cathedral, the Louvre, oh and of course, the tower!
- ▶ We give instructions From Dam square you head north on Damrak till you see it, really, you can't miss it.

What about processing language?

It's everywhere!

- We talk about things I love Paris! All those bridges, the cathedral, the Louvre, oh and of course, the tower!
- ▶ We give instructions From Dam square you head north on Damrak till you see it, really, you can't miss it.
- We entertain ourselves

Eleanor Ribgy

... picks up the rice In the church where a wedding has been Lives in a dream Waits at the window, wearing the face That she keeps in a jar by the door Who is it for

I've had a wonderful weekend! I always wanted to buy a melodica. On Saturday, I finally went to that fancy music store in Haarlem. The rest of the weekend, I practised some of my favourite songs on it

I've had a wonderful weekend! I always wanted to buy a melodica. On Saturday, I finally went to that fancy music store in Haarlem. The rest of the weekend, I practised some of my favourite songs on it.

meaning of words, phrases, and sentences
 A melodica is a musical instrument, Haarlem is a place

Wilker Aziz NTMI 2020 - week 1a

I've had a wonderful weekend! I always wanted to buy a melodica. On Saturday, I finally went to that fancy music store in Haarlem. The rest of the weekend, I practised some of my favourite songs on it.

- meaning of words, phrases, and sentences
 A melodica is a musical instrument, Haarlem is a place
- relationships between sentencesI went because I wanted to buy a melodica

Wilker Aziz NTMI 2020 - week 1a

I've had a wonderful weekend! I always wanted to buy a melodica. On Saturday, I finally went to that fancy music store in Haarlem. The rest of the weekend, I practised some of my favourite songs on it.

- meaning of words, phrases, and sentences
 A melodica is a musical instrument, Haarlem is a place
- relationships between sentencesI went because I wanted to buy a melodica
- implicationsThe melodica was bought at that store in Haarlem

Wilker Aziz NTMI 2020 - week 1a

I've had a wonderful weekend! I always wanted to buy a melodica. On Saturday, I finally went to that fancy music store in Haarlem. The rest of the weekend, I practised some of my favourite songs on it.

- meaning of words, phrases, and sentences
 A melodica is a musical instrument, Haarlem is a place
- relationships between sentencesI went because I wanted to buy a melodica
- implications
 The melodica was bought at that store in Haarlem
- impressions about speaker/writer style
 The writing is boring or funny or engaging

Adapted from A. Louis, S. Goldwater, I. Titov, K. Sima'an, T. Deoskar

All of this understanding plays a role when we

- Make conversations with other
- Translate from one language to another
- Create a summary of a document
- Find an answer to a question from a text

NLP then is about enabling computers to do some of these tasks

- How to study/analyse language in computational terms?
- ► How to build applications that will do these tasks automatically?

Goals of NLP

Scientific

▶ Build models of the human use of language

Engineering

- Build models that serve in technological applications
 - machine translation
 - speech systems
 - information extraction, etc.

Goals of NLP

Scientific

▶ Build models of the human use of language

Engineering

- Build models that serve in technological applications
 - machine translation
 - speech systems
 - information extraction, etc.

In this course we

- draw insights from scientific knowledge
- but mostly focus on engineering aspects
- and rely on language data in the form of digital text

NLP Applications

- ► Information retrieval: Google
- ► Summarisation: Google News
- Speech recognition: Siri, Alexa, Google Home
- Dialogue systems: Amazon chatbot
- Machine translation: Google translate
- ► Image captioning: Microsoft, Facebook
- Recommendation systems: Amazon reviews
- Social network analysis: Facebook, Twitter

Why NLP?

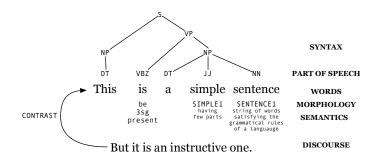

Why is NLP hard?

An overview of problems

An overview of the statistical method

Language data: first contact

Basic levels of structure

Slide from S. Goldwater

Wilker Aziz NTMI 2020 - week 1a

Ambiguity at many levels

- Word senses: bank (finance or river?)
- Part of speech: chair (noun or verb?)
- Syntactic structure: I saw a man with a telescope
- Quantifier scope: Every child loves some movie
- ► Multiple: I saw her duck

and ambiguity typically grows with sentence length

Wilker Aziz NTMI 2020 - week 1a

Ambiguity at many levels

- Word senses: bank (finance or river?)
- Part of speech: chair (noun or verb?)
- Syntactic structure: I saw a man with a telescope
- Quantifier scope: Every child loves some movie
- Multiple: I saw her duck

and ambiguity typically grows with sentence length

Examples from newspaper headlines

Iraqi head seeks arms Stolen painting found by tree Teacher strikes idle kids

Adapted from T. Deoskar

Variability (paraphrasing)

- Emma burst into tears and he tried to comfort her, saying things to make her smile.
- ► Emma cried, and he tried to console her, adorning his words with puns.

Different genres

Suppose we train a part of speech tagger on the Wall Street Journal

Mr./NNP Vinken/NNP is/VBZ chairman/NN of/IN Elsevier/NNP N.V./NNP ,/, the/DT Dutch/NNP publishing/VBG group/NN ./.

What will happen if we try to use this tagger for social media??

ikr smh he asked fir yo last name

Languages are different

- ▶ Chinese sentences do not have delimiters between words
 - (a) Raw data:

```
他还提出--系列具体措施和政策要点。
```

(b) Segmented:

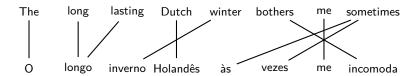

```
他 还 提出 一 系列 具体 措施 和 政策 要点 。
He also propose one series concrete measure and policy essential .
```

(He also proposed a series of concrete measures and essentials on policy.)

Example from Xue et al. (2005)

Wilker Aziz NTMI 2020 - week 1a

Languages have different word orders

Myself (2018)

Context dependence

correct interpretation typically requires context and often requires world knowledge Paris is so beautiful, the city or the celebrity?

Context dependence

correct interpretation typically requires context and often requires world knowledge Paris is so beautiful, the city or the celebrity? especially when seen from the tower

Context dependence

correct interpretation typically requires context and often requires world knowledge Paris is so beautiful, the city or the celebrity? especially when seen from the tower

Unknown representation

we don't know how humans represent knowledge

NLMI

Course organisation

Why NLP?

Why is NLP hard?

An overview of problems

An overview of the statistical method

Language data: first contact

Sequence prediction

What is the next word?

Sequence prediction

What is the next word?

Not every word is equally likely to continue a certain prefix

we typically make meaningful and grammatical sentences

Sequence segmentation

Some languages are based on continuous scripts Wiki

▶ for example Chinese and Thai

In English, words are generally clearly delimited

- but we still care about tokenisation
 - input: I am not missing it, neither should ya!
 - output: I am not missing it , neither should ya !

▶ quiz

Sequence segmentation

Some languages are based on continuous scripts Wiki

► for example Chinese and Thai

In English, words are generally clearly delimited

- but we still care about tokenisation
 - input: I am not missing it, neither should ya!
 - output: I am not missing it , neither should ya !

▶ auiz

It is not necessarily clear what it means to find a segmentation

- we are either looking for meaning carrying parts
- or trying to minimise the cost of representation

Sequence labelling

We are often interested in analysing sentences

- we can classify words with respect to parts of speech apple is a noun
- and context usually plays a role I chair_{verb} debates all the time, and usually I do not have a chair_{noun} to sit on
- some words may refer to an entity
 Leibniz was a German mathematician

It's similar to sequence prediction, but with additional context

it may require far more knowledge of the world

Morphological disambiguation

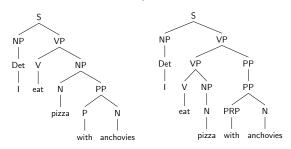

Words have meaning carrying and functional parts

- English -ly usually derives an adverb from an adjective
- less often English can use agglutination or compounding to make new words
 wrongdoing is wrong + doing
- there are ambiguities
 - s marks plural in cats, third person in it marks, nothing in news
 - with a verb un means "reversal", e.g. untie with an adjective un means "not", e.g. unwise
- ▶ other languages are far more complex ▶ Wiki

Syntactic parsing

We can take the idea of sequence labelling and push it a bit farther

- ▶ label every "coherent" substring in a sentence a constituent
- ► and we can do so recursively

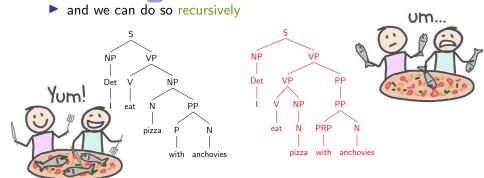

which one has a funny interpretation?

Syntactic parsing

We can take the idea of sequence labelling and push it a bit farther

► label every "coherent" substring in a sentence a constituent

which one has a funny interpretation?

nesting tells us about syntactic dependencies

Semantic parsing

We may be interested in the semantic role of constituents with respect to a predicate wiki rather than their syntactic function

Answer questions such as

who did what to whom, when and why?

I	will	give	you	the	book	if	you	give	me	the	pen
GIVING PA		PART_ORDERED_SEGMENTS			GIVING			TEXT_CREATION			
					Part						
Donor			Recipient		Theme		Donor		Recipient		Theme

Text-to-text transformation

29

We can combine sequence prediction with sequence labelling and a few more things to translate sequence sequence.

▶ quiz

or summarise

Google seq2seq

Much more

- coreference resolution
- discourse analysis
- question answering
- paraphrasing
- translation equivalence
- word alignment

NLMI

Why NLP?

Why is NLP hard?

An overview of problems

An overview of the statistical method

Language data: first contact

But how can we do that?

Statistical approach

or the "probabilistic pipeline"

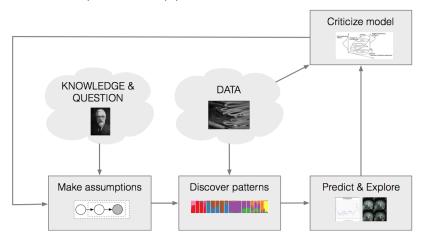

Image by David Blei

Pipeline

We have knowledge about the world and we have questions we want to answer

so we can design a model: encodes our knowledge and assumptions

Pipeline

We have knowledge about the world and we have questions we want to answer

so we can design a model: encodes our knowledge and assumptions

We have data that by assumption somewhat comply with our assumptions

so we can use statistics to discover patterns in data

Pipeline

We have knowledge about the world and we have questions we want to answer

so we can design a model: encodes our knowledge and assumptions

We have data that by assumption somewhat comply with our assumptions

so we can use statistics to discover patterns in data

We typically want to predict things or explore things

- again statistics can help us make decisions
- predict future outcomes
- organise unstructured data in some structured way

What do people talk about in the Wall Street Journal?

Topics found in 1.8M articles from the New York Times

Wilker Aziz NTMI 2020 - week 1a [Hoffman+ JMLR 2013]

Why NLP?

Why is NLP hard?

An overview of problems

An overview of the statistical method

Language data: first contact

Let's start with the frequency of words

There are always phenomena which are important but have rare evidence in data: Zipf's Law Wiki.

Let's start with the frequency of words

There are always phenomena which are important but have rare evidence in data: Zipf's Law WIND.

the frequency of any word is inversely proportional to its rank in the frequency table. Thus the most frequent word will occur approximately twice as often as the second most frequent word, three times as often as the third most frequent word, etc.

Let's start with the frequency of words

There are always phenomena which are important but have rare evidence in data: Zipf's Law WIKE.

the frequency of any word is inversely proportional to its rank in the frequency table. Thus the most frequent word will occur approximately twice as often as the second most frequent word, three times as often as the third most frequent word, etc.

- ➤ To illustrate, let's look at the frequencies of different words in a large text corpus.
- Assume a "word" is a string of letters separated by spaces (a great oversimplification as we know by now)

Word Counts

Most frequent words in the English Europarl corpus out of 24 million tokens

any word

nouns

Token			
the			
of			
to			
and			
in			
that			
is			
а			
I			

Frequency	Token					
124,598	European					
104,325	Mr					
92,195	Commission					
66,781	President					
62,867	Parliament					
57,804	Union					
53,683	report					
53,547	Council					
45,842	States					

Word Counts

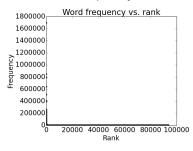

Out of 93638 distinct words (word types), 36231 occur only once!

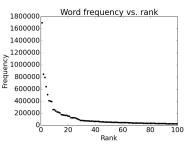

Examples:

- cornflakes, mathematicians, fuzziness, jumbling
- pseudo-rapporteur, lobby-ridden, perfunctorily,
- Lycketoft, UNCITRAL, H-0695
- policyfor, Commissioneris, 145.95, 27a

Plotting word frequencies

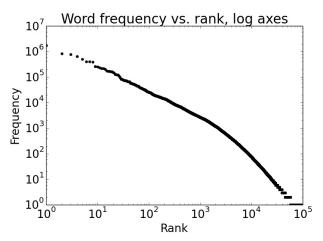

If we order words by frequency, what is the frequency of nth ranked word?

Rescaling the axes

To really see what's going on, use logarithmic axes:

Zipf's law

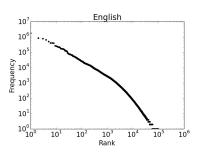

Summarises the behaviour we just saw:

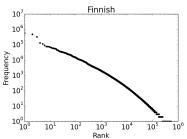

$$f \times r \approx k$$

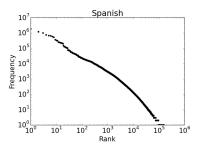

- ightharpoonup f = frequency of a word
- ightharpoonup r = rank of a word (if sorted by frequency)
- ightharpoonup k = a constant

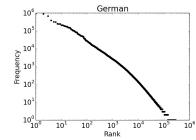

Why a line in log-scales?

What about other languages?

Implications of Zipf's Law

- Regardless of how large our corpus is, there will be a lot of infrequent (and zero-frequency!) words.
- In fact, the same holds for many other levels of linguistic structure (e.g., syntactic rules).
- ► This means we need to find clever ways to estimate probabilities for things we have rarely or never seen.

Scope of the course

In this course you will learn about

- probabilistic modelling
- statistical inference and estimation
- how to represent language data
- discovering patterns in text collections

Topics

- Markov models: including language models and sequence prediction
- Mixture models: sequence labelling and PCFGs
- Models of distributional semantics: word representation
- ► Translation equivalence: learning dictionaries

Topics

- Markov models: including language models and sequence prediction
- Mixture models: sequence labelling and PCFGs
- Models of distributional semantics: word representation
- Translation equivalence: learning dictionaries

See you next time for

a review of probabilities and parameter estimation
